

MOTIVATIONAL ESSAY

My name is _____ and I graduated the _____ High School, Mathematical-Informatics profile, in the City of _____, _____ County, June-July 2019 session.

"Nature never does anything without reason." Aristotle once said. Of course, the man was and still is, a force of nature. But "man can rule nature while respecting its laws" (G. Antipa)

Unfortunately, "we have so altered our environment that we must now adapt ourselves to be able to exist in this environment," said the American mathematician Norbert Wiener, the founder of cybernetics, a distinguished personality of science, also interested in the changes that the evolution of technology produces on nature.

Intrigued by these issues and finding myself at the time of choosing a profession to characterize me and to be attracted to, I must admit that technology itself helped me find the necessary information on the official site of the **Bucharest Academy of Economic Studies** through its educational offer, and the **Faculty of Agro-Food and Environmental Economics** is undoubtedly the perfect choice for someone who believes nature is the foundation of our existence.

The intrinsic link between man and nature, so often present in art in all its forms, is well known, but I believe that man should be aware that he owes his existence to the boundless power of nature.

Passionate, of course, of the environment, I have to say that it is also responsible for a healthy diet and our country has countless resources to benefit from everything we need, we should take advantage of our rural space, giving it the chance it has not benefited so far, and surely this faculty offers this opportunity to students.

Here, I am convinced that I will have the chance to learn from agri-food and environmental professionals, to attend classes held by passionate teachers who will surely be able to inspire me, to motivate me to evolve during not only the three years of college but also afterward, because I believe that a master degree in the field is the next step, this being an imperative when it comes to deepening and specializing.

At the same time, the faculty offers the opportunity to participate in various projects, study programs, volunteer actions, internships that will help me to develop communication, organization, relationship, personal development skills. And last but not least, I consider that the practice in the field is the process underlying the training of the necessary skills at the moment of integration into the labor market.

Since high school years I have been involved in various volunteer activities and experienced exchanges with high schools in France and Croatia in the Erasmus⁺ projects.

I am confident that what I have gained during this period will also be useful to me, for sometimes only punctual book science is not sufficient, interdisciplinary education is perhaps primary, and participation in as many activities as possible in various fields makes more valuable the years of study, but also much more beautiful.
